This paper conclude from the above data that Nepal is more global but of regional sustainable development from 2005 to 2010. The DSD is larger than 0.25. The footprint is slightly higher than the biocapacity. Because the height above sea level of Nepal is very large and the north area of Nepal is close to the Himalayas and the natural environment of Nepal is bad, thus 80 percent of its population are engaged in agricultural production. It is one of the least undeveloped countries in the world. The industry foundation of Nepal is very weak. Its industry scale is small and degree of its mechanization is very low. Nepal develops very slowly and receives the aids of other countries for a long time. Through the mathematical model, we make the assistance program plan.
